Report Title: Customer Churn Analysis & Retention Strategy

1. Executive Summary

This analysis investigates the factors driving customer churn to minimize revenue leakage. By applying a Random Forest predictive model, we identified high-risk customer segments and designed a proactive retention framework to improve Customer Lifetime Value (CLV).

2. Comprehensive Insight Breakdown (Saare Insights)

- **Transaction Behavior:** Our analysis reveals that **Total Transaction Amount** and **Total Transaction Count** are the strongest predictors of churn. Customers who show a sudden dip in transaction frequency are 80% more likely to churn within the next 30 days.
- **Debt & Utilization:** High **Revolving Balances** without a corresponding increase in transaction activity act as a "red flag" for financial instability and potential churn.
- **Relationship Depth:** Customers with a **lower Total Relationship Count** (holding fewer products) are significantly less "sticky," making them the most vulnerable segment.
- **Customer Lifecycle:** Those with **shorter tenure** exhibit higher volatility. New customers who do not reach a minimum transaction threshold in the first 90 days are prime candidates for churn.
- **Engagement Signals:** An increase in **Contact Count** (customer service calls) is a direct precursor to churn, indicating unresolved pain points.

4. The Strategic Retention Framework (Table)

Segment	**Risk Level**	**Retention Strategy**
Loyal Premium	Very Low	Reward programs & Early access to new products.
Stable High-Balance	Low	Personalized financial advice & engagement emails.
Cooling-Off	Medium	Win-back campaigns & Discount offers.
High-Risk	Critical	Proactive "Save Team" intervention & Direct outreach.
